

Making local bricks in the Nakivale refugee camp to rebuild our center demolished by the rain provides an affordable building material for shelters and other structures. Here is a general overview of the process by Arsene Kibukila:

Materials Needed

1. Clay Soil: The main material for brick making, clay soil must be readily available.
2. Water: Used to mix the clay soil and facilitate brick making.
3. Form to shape the bricks

Process

1. Soil Preparation: Collect and prepare the clay soil, removing debris and impurities.
2. Mixing: Mix the clay soil and water to obtain a malleable mixture.
3. Form: Pour the mixture into molds and shape the bricks into the desired shape.
4. Drying: Allow the bricks to dry in the sun or in a controlled environment.

Community involvement*: Involvement of the refugee community in the brickmaking process.
